

Taking a great photo! - Has your garden escaped? A conservation project

DO

1. Ensure photos are sharp and in focus. **Tip:** You can put your hand directly behind the plant to improve the focus of your camera.
2. Keep the sun behind you for the best lighting in your photos and if the light is too bright, you can use your body or backpack to provide some shade.
3. Try to get as much detail of the plant in the shot as possible. Think about what is necessary in the shot for identification of the plant species.

AVOID

1. Taking photos with the flash on as this can limit finer details that will assist in identification.
